

From 12 days to 2 days: make NNC treatment faster and easier to control

Story-first kickoff slide for a mixed U.S. audience: problem → target → impact → scope → plan → questions

THE CHANGE WE NEED

12 days
current P90 lead time

2 days
target lead time

Why it matters

31-day lead time for reworked parts
puts delivery commitments at risk

1 THE PROBLEM

NNC treatment takes too long

P90 lead time today: 288h / 12 days
Too long to secure on-time delivery
Reworked parts can reach 31 days lead time

Plain-English message: “We are losing time before parts can move forward.”

2 WHY IT MATTERS

Impact beyond the metric

Serviceability of parts
Respect of commitments
Customer satisfaction under contract
Lower parts holding costs

Plain-English message: “Shorter treatment time protects the customer promise.”

3 WHERE WE WILL ACT

Focused scope + clear roadmap

In: turbine nozzles and blades (CFM56 & LEAP)
Out: GE engineering analysis / CSC cases (~2%)

DMAIC roadmap

Speaker route: who you are → why this matters → 12-day problem → 2-day ambition → focused scope → roadmap → invite questions on assumptions and risks.
